AI Tools Comparison for Research

This section documents the use of two AI tools to aid in the research and development of this privacy audit assignment.

Aspect	DeepSeek	ChatGPT
Tool Used	DeepSeek Chat (Latest Version)	ChatGPT GPT-5
Primary Prompts	"List applications that actively collects personal (e.g., health, financial, location or identifiable data) and non-personal data (e.g., logs, measurements unrelated to human). Applications could include smart cars, smart homes, emotion AI system, smart health solutions, or other ideas. " "Create a comprehensive privacy governance framework for LetsPayMate P2P payment app that integrates GDPR, NIST Privacy Framework, and OECD principles." "Develop detailed privacy management checklists for data collection compliance and security controls effectiveness." "Generate Mermaid JS code for LetsPayMate data flow diagram showing all entities and data stores."	"List applications that actively collects personal (e.g., health, financial, location or identifiable data) and non-personal data (e.g., logs, measurements unrelated to human). Applications could include smart cars, smart homes, emotion AI system, smart health solutions, or other ideas." "Identify 20-30 specific data types for a P2P payment app, categorized as personal, sensitive, and non-personal." "Create a data classification table using NIST and GDPR standards for payment app data types." "Build a privacy threat model identifying key actors and their threats to data privacy."
Advantages	- Excellent for creating structured frameworks and documentation - Strong understanding of technical implementations - Good at generating code and visual	- Excellent for brainstorming and idea generation - Strong at categorization and table creation - Good at breaking down complex

	diagrams - Free access with no usage limitations - Effective at creating actionable procedures and checklists	concepts - Responsive to iterative refinement - Useful for quick drafts and initial outlines
Limitations	- Can be overly technical for non-technical topics - Sometimes misses nuanced regulatory interpretations - Less strong in creative brainstorming - Responses can be too structured and lack flexibility	- Can produce generic content requiring significant refinement - Limited depth in technical specifications - May provide superficial regulatory analysis - Less capable with code and diagram generation
Contribution to Assignment	- Complete privacy governance framework structure - Detailed privacy management checklists - Data flow diagram code and technical specifications - Lifecycle management protocols - Security control recommendations	- Initial data types of identification and categorization - Data classification table foundation - Threat model core concepts - Application scenario development - Initial research brainstorming

Key Insights Gained

1. **Specialized Strengths:** DeepSeek excelled in creating structured frameworks and technical documentation, while ChatGPT was more effective for initial brainstorming and concept development.
2. **Cost Efficiency:** Both tools offered free access options, making them accessible for academic research without budget constraints.
3. **Workflow Optimization:** Using ChatGPT for initial ideation and DeepSeek for detailed framework development created an efficient research pipeline.
4. **Technical vs Creative:** DeepSeek provided better technical precision for diagrams and checklists, while ChatGPT offered more creative approaches to problem identification.
5. **Verification Need:** Both tools required verification of regulatory interpretations against primary sources, though DeepSeek showed better accuracy in technical specifications.

6. **Time Savings:** The combined use reduced research and drafting time by approximately 40-50%, particularly in framework structuring and documentation formatting.

The complementary use of both tools enabled comprehensive coverage of both creative brainstorming and technical implementation aspects, resulting in a more thorough and well-structured final assignment.
